JmGallery

JmGallery is a simple to use slide show available as plugin or module. JmGallery is built on the JQuery plugin Galleriffic and the TimThumb PHP Image Resizer. The TimThumb generates the thumbnails from the slides. For performance reasons it is advisable to limit the size of the images. Take the same values as given in the parameters of the module or plugin.

In both the plugin and module the use of a caption is possible. The options are: no caption, the file name as caption or the caption is taken from the description field of the metadata (IPTC) of the image. If no metadata is fond the filename is used instead.

Plugin

The **plugin** substitutes in a article the string {jmgallery map=xxxx} by the jmgallery. xxxx is the subdirectory of the directory given in the plugin parameters. This directory on its turn is a subdirectory of the joomla images folder.

The following overrides are possibel:

The **caption** parameter overrides the default plugin parameter.

{jmgallery map=xxxx;caption=y} where y is:
0 is no caption
1 is filename as caption
2 is the metadata as caption

The **widht** parameter overrides the default plugin parameter

{jmgallery map=xxxx;width=yyyy} yyyy is the width in pixels.

The **ratio** parameter overrides the default plugin parameter.

{jmgallery map=xxxx;ratio=z}
z=1 for 16x4
z=2 for 4x3

The height parameter overrides its default plugin parameter and the ratio parameter, either the default or in the plugin string.

{jmgallery map=xxxx;widht=yyyy;height=aaaa} aaa is the height in pixels

Module

This **module** places on a module position the jmgallery. The directory of the images is given in the module parameters.
